

Swop × x402: Native Agentic Commerce

Every Swop onboarding produces an AI-agent-payable storefront — automatically.

The bullet point

x402-native commerce. Swop integrates the x402 payment protocol (the HTTP-native stablecoin standard created by Coinbase, backed by Stripe, ~165M agent transactions to date) directly into its identity and checkout stack. When a user onboards to Swop — claims a swop.id, builds their SmartSite, and adds products — their storefront is automatically payable by AI agents in USDC, with no additional integration, no API keys, and no merchant onboarding. Swop is the rail that makes any person or business agent-payable by default.

How it works

- **Identity is the merchant account.** A swop.id resolves to its owner's wallet addresses through Swop's public identity API. There is nothing extra to set up — the handle itself is the payout destination.
- **Products become machine-payable endpoints.** Every product a user adds to their SmartSite is exposed at an x402 endpoint. A human opening the link sees the normal checkout; an AI agent receives HTTP 402 with exact machine-readable payment instructions (amount, USDC, network, pay-to).
- **Agents pay in one round trip.** The buyer's agent signs a USDC transfer, retries with payment proof, the x402 facilitator verifies and settles on-chain, and Swop's existing USDC settlement pipeline handles the rest. The seller is paid exactly as if a human had checked out.
- **Discovery is built in.** Swop ships an MCP server (mcp.swopme.co) already live in Claude, ChatGPT, and the open MCP Registry, and addable to Grok. Agents can search swop.ids, browse a handle's products, and purchase — end to end — inside a chat.

Why it matters

Agentic checkout is arriving on two tracks: card-tokenization protocols for legacy stores, and x402 for crypto-native rails. Card-based stores must each integrate agent checkout; Swop users get it as a side effect of onboarding. The pitch to any merchant becomes: keep your existing site, add your Swop link, and every AI agent with a funded wallet is now a customer. Combined with Swop's USDC-only settlement and sponsored-gas UX, this positions Swop as the default commerce layer for the agent economy rather than an add-on to it.

Status

Live today	x402 storefronts LIVE on mainnet for every Swop seller: real-USDC sales settled (digital direct; physical with shipping capture + escrow, wallet-signed release). MCP server live in Claude, ChatGPT, and the MCP Registry; OAuth account linking live.
Near term	Mobile approve screen for account linking; platform fee capture; directory listings (Anthropic, OpenAI).
Roadmap	Paid premium MCP tools (per-call USDC pricing); Swop-wallet-funded agent spending; USDC card issuance for off-rail spend.

Swop · swopme.co · mcp.swopme.co · August 2026. x402 is an open protocol by the Coinbase Developer Platform; adoption figures per public protocol reporting, April 2026.
