

MCP · x402 Commerce · Account Linking · Delegated Sends

State as of Aug 31, 2026. Everything below is live in production unless marked otherwise. For other agents/engineers picking up any lane.

Shipped & live in production

Area	What works today
MCP server	mcp.swopme.co/mcp — 19 tools. Connected in Claude & ChatGPT; listed in the MCP Registry (io.github.Travisswop/swop v0.1.1). Repo: github.com/Travisswop/swop-mcp (server + all design docs + PDFs).
x402 commerce	Every Swop seller's products are agent-payable in mainnet USDC. Digital = instant settle to seller; physical = agent supplies shipping (X-ORDER) + escrow, released on wallet-signed receipt confirmation. Auto-indexed to Coinbase Bazaar. Backend: swop-app-backend /api/v5/x402/*, flag ENABLE_X402_STOREFRONT.
Account linking	OAuth 2.1 (PKCE) at apps.apiswop.co/oauth. Users link Swop in Claude/ChatGPT via QR-approve in the Swop app OR Privy email-code fallback. Scoped tools: profile/balances/orders read, edit SmartSite, create products. Flag ENABLE_MCP_OAUTH.
Delegated sends	Agents can send USDC from a user's wallet within per-tx/daily caps (server-side policy + ledger). swop_send is two-step preview→confirm. Executes via Privy once the user grants consent in-app; else returns a confirm-in-app link. Flag ENABLE_MCP_DELEGATION.
Identity API	Public swop.id → wallet resolution (lookup + search) live. Powers identity MCP tools + agent recipient resolution. Flag ENABLE_PUBLIC_IDENTITY_API.
Email	All 5 transactional flows consolidated onto Resend (SendGrid key was dead). Domain mail.swopme.co verified. Legacy welcome/password-reset gated OFF (passwordless login).

Where the code lives (no separate commerce/KYC repos)

swop-mcp (new repo) — the MCP server + design docs (DESIGN-phase2-oauth.md, DESIGN-phase3-delegation.md) + CSA/discovery PDFs + SUBMISSION.md. Deploys to Vercel (mcp.swopme.co). **swop-app-backend** — ALL commerce/OAuth/delegation logic (x402*, mcpOAuth*, mcpDelegation*, McpOAuth/McpDelegation models). Deploys: write on **main**, merge to **production**, run scripts/deploy-prod.sh (manual; ECS swop-prod). **swop-mobile-expo** (iCloud clone) — the AI Assistants + confirm-tx + link approve screens.

What's left — by owner

Item	Owner	Notes
OTA the mobile screens	DECISION	AI Assistants + confirm-tx + link-approve screens are on mobile main , typechecked, NOT published. Highest-impact remaining: until OTA, phone users can't enable AI spending. Mostly JS → OTA-able.
Android store build	DECISION	Bare swopme.app intent-filter host committed (505ce27) — needs a native build, not OTA. iOS universal links already work. Fold into next store release.
Claude directory listing	BLOCKED	Needs a Claude Team/Enterprise org (Travis not upgraded). Submission kit ready in SUBMISSION.md; ~1 day once org exists.

OpenAI App Directory	PROJECT	Not a form — OpenAI Apps-SDK submission + review on the dev platform. Swop already usable in ChatGPT via URL. Scoped effort needing dev-account decisions.
Phase-3 slices 2–4	BUILD	swop_swap, prediction bets, pay-external-x402-links. Same preview→policy→execute pattern, ~1 day each. Expansion, not blocking.
Desktop fulfillment link	BUILD	“Manage fulfillment” link on the order payments-tab (seller shipping controls only show on the Sold tab today). Small desktop-app fix.
x402 platform fee	PARKED	Launched at 0% deliberately. Build the 50bps route-through (via settlement wallet) when volume justifies.
KYC + Stripe rail	OTHER AGENTS	Card/Link buyers + Stripe Connect USDC payouts. Owned by other agents in their own repos — not this lane. Ask them to note repo(s) in SwopLive/CLAUDE.md.

Load-bearing facts for whoever continues

- **Delegated auto-send requires in-app Privy consent.** The backend signs a user’s embedded wallet only after they enable “AI Assistants” in the app (Privy delegateWallet). Without it Privy returns 401 “no valid authorization signatures” and the send degrades to a confirm-in-app link — by design, not a bug.
- **Backend deploys are manual + creds expire hourly.** Push production, then run scripts/deploy-prod.sh. AWS SSO token dies ~hourly (“aws login” re-auths via browser). The ServicesStable waiter often dies on expired creds AFTER the roll succeeded — verify via /health uptime + [LogSelfCheck] build sha, never re-run blindly.
- **Every new capability ships dark behind a flag** (ENABLE_*), set on the ECS api task-def env. Flip by cloning the task-def + rolling the api service.
- **Payout is USDC-only** and x402 currently pays sellers 100% (no platform fee). Identity search makes handle→wallet enumerable (accepted, ENS-equivalent).

Swop · backend production tip 84c08a05 · mcp.swopme.co · Aug 31 2026. Canonical live-state notes: session memory swop-mcp-server.md.
x402 = Coinbase HTTP-402 stablecoin standard; MCP = Anthropic Model Context Protocol.
