

The Storefront AI Agents Can Find, Read, and Pay

Every Swop link is simultaneously a web page for humans and an API for AI agents. No integration, no listing fees, no app required to buy.

Why this is a differentiator

Every commerce platform is scrambling to become "agent-ready" — bolting agent checkout onto card rails, negotiating one-off integrations with each AI vendor. Swop inverted the problem: the storefront itself speaks the two open protocols AI agents already use. **MCP** (Model Context Protocol — how assistants discover and call tools) makes Swop searchable and operable inside Claude, ChatGPT, and Grok. **x402** (the HTTP stablecoin payment standard, ~165M agent transactions to date) makes every product URL directly payable in USDC. Nothing here is a demo: all of it is live in production and has settled real money.

How an AI finds and buys a product — three paths, zero apps

- **Connector path.** A user adds the Swop connector (one URL: mcp.swopme.co/mcp). Their assistant instantly knows how to search swop.me, open any storefront, read prices, and pay — the tools describe themselves to the model. "Find travis on Swop and buy his Cabal Card" is a complete, working instruction.
- **Link path.** Every store and product is a plain HTTPS URL. Shared in a tweet, a chat, a bio — any agent that can fetch a web page gets machine-readable JSON back, and the product link answers with exact x402 payment instructions. The same link serves a human a checkout page and an agent an invoice.
- **Directory path.** Swop is published in the open MCP Registry (indexed by AI clients), with Anthropic and OpenAI directory listings in progress and x402 endpoint indexes (Coinbase's discovery layer for agent-payable services) on the roadmap — putting every seller's products in front of autonomous buying agents that have never heard of Swop.

The seller does nothing

Onboard to Swop, claim a swop.me, add a product — that's the whole integration. The handle resolves to the payout wallet; the product becomes an agent-payable endpoint the moment it's created. Digital goods settle USDC straight to the seller. Physical goods collect the buyer's shipping address from the agent before any payment is accepted, hold funds in escrow, and release on a cryptographic receipt confirmation signed by the very wallet that paid — buyer protection with no account, no login, no middleman.

Proven in production

Live commerce	Real-USDC sales settled on Base mainnet: digital direct-to-seller; physical with agent-supplied shipping, escrow hold, and wallet-signed release. Orders, inventory, and seller notifications flow through the same pipeline as human checkout.
Live distribution	MCP server live and transacting inside Claude and ChatGPT; listed in the open MCP Registry; addable to Grok today with one URL.
Live account linking	OAuth 2.1 with QR approval in the Swop app (or email magic link): users check balances, view orders, edit their SmartSite, and create products from inside any AI — products that are instantly purchasable by other agents.

Economics

x402 payments cost effectively zero (no card fees, facilitator-sponsored gas, sub-cent network costs) and settle in minutes — launch pricing passes 100% to the seller.

The takeaway: while others integrate with the agent economy, Swop users are simply **in** it — every profile a directory entry, every product an endpoint, every payment a settled stablecoin transfer. That is the moat: not a feature bolted on, but the platform's native shape.

Swop · swopme.co · mcp.swopme.co · August 2026. MCP is an open protocol originated by Anthropic; x402 by the Coinbase Developer Platform (backed by Stripe, Cloudflare, AWS); volume figures per public protocol reporting, April 2026.
